

# THREATS TO BEES AND OTHER POLLINATORS

Bees, butterflies, and other animals are really important for pollination. Without these helpful animals, many plant species couldn't survive. However, lots of pollinators are under threat and need our help.

Here are some problems facing pollinators today. Read each one carefully and try to suggest something we can all do to help make the world a better place for bees, butterflies, and other pollinators.

## **Water pollution**

Poisonous to plants and animals.

## **Habitat loss**

Pollinators need safe places to live and raise their young.

## **New predators**

Invasive species can cause lots of problems.

## **Pesticides**

Chemicals used on crops can be seriously harmful to pollinators.

## **Climate change**

Disruptions to weather and temperature can cause big problems.

## **Air pollution**

Poisons in the air make it harder for pollinators to breathe.

**Choose one of these problems that you think is the most important. Make a poster to inform your friends about this problem and give them some tips on how they can help.**
